

Basics of the Component Section

Component is the base level of data in RISCm, everything else links to the component

Creating a new Component Record

To create a new record in component, click the component link in the menu at the top of RISCm to go to the component section. Then click the “New” button at the bottom left.

The form will empty and some fields will be highlighted in blue. These fields are mandatory and to save the new record, you must fill them in.

The location box is a very important field but not considered mandatory. The location field is used as a textual guide as to where the component is and the camera icon next to it will show the main image (if one exists, if not the camera icon is disabled), which is meant for a locator image as opposed to a corrosion inspection image for example.

Cloning and Deleting Records

You can now clone any component record and also delete them. To clone, click the clone button, create clone and then save. However, you may notice that there is a checkbox on the clone button itself, when the box has been ticked, it will also clone the subtables and drawings. If you uncheck it, only the main data will be cloned.

To delete, click the delete button. Deleted records will go to the archive from where they can be restored.

Drawings and Images

Drawings and images are added from the Resources tab. Drawings at the top left and Images at the bottom left. You can click the small button next to the drawing to preview it. The main image will also be displayed in the report.

Reports

To generate a report, you can click reports at the top and choose the style of report you wish to generate or print. There are two buttons at the bottom, one to print and one to save the PDF to a file. Don't forget when you do this, to run a filter so that you're not generating reports on thousands of records.
